

Planning, Scheduling and Coordination Assessment

Many companies are looking for ways to improve reliability and availability of their assets. The issue can be getting started and producing results.

MET DEMAND has developed an assessment to assist organizations in getting on the road to improving equipment performance. Many have heard the statement, "Poor Planning on your part does not mean a crisis on mine." If we are not thoroughly planning, scheduling and coordinating maintenance work, we mandate that the shop floor be reactive to manage a self induced crisis.

This one-day review is not a complete Reliable Capacity™ Assessment, but can be used to get some new ideas on how to plan and schedule resources to maximize equipment capacity.

Planning, Scheduling and Coordination Assessment evaluates your organization's maintenance processes against World Class Practices identifying gaps in performance. This one-day session focuses on Maintenance's Work Control Process.

- Work Identification
- Work Prioritization
- Work Approval
- Work Verification
- Work Planning
- Material Procurement
- Work Kitting and Staging
- Work Scheduling
- Work Coordination
- Process Improvement
- Work Closure
- Work Reporting

If your organization is struggling with getting started in improving asset performance, the Planning, Scheduling and Coordination Assessment can help. This assessment can help bring understanding about non-value and value-added activities effecting equipment availability and productivity.
